

=MARCH.= \_III Month.\_

Where Goodness worthy of a God bestows  
 His Gifts on all, and without Bounds o'erflows;  
 Where Wisdom bright appears, and Pow'r divine,  
 And where Infinitude itself doth shine;  
 Where Excellence invisible's exprest,  
 And in his glorious Works the God appears confest.  
 With Life thy Hand hath stock'd this earthly Plain,  
 Nor less the spacious Empire of the Main.

of Fire turns once round in about twenty-five Days. This is known by a Number of dusky Spots, which appear upon the Sun's Face, so as to be seen sometimes with the naked Eye, when he shines through a thin Cloud or Mist; but are always observable with the Help of a Telescope, with a dark Glass for the Security of the Eye. These Spots could not be visible at the Distance of the Sun, if they were not as large as the whole Earth; but such of them as appear of a considerable Breadth, as they often do, must be still vastly larger. They never continue long to make the same Appearance; but are always rising and vanishing again. They are probably Exhalations floating in the Sun's Atmosphere at some Distance from his Body, or Masses of Cynder fallen from that Atmosphere upon his Surface.

This glorious Luminary, the Centre of our System, has six opaque Globes, commonly called the Planets, going round him at different Distances, and in different Periods, but all from West to East, as follows.

1. Mercury, a Body considerably inferior in Size to the Earth, performs his Course in about three Months, which is his Year, at the Distance of thirty Millions of Miles from the Sun. The Heat of the Sun in Mercury (if there be no Provision made for mitigating it) must be such, as, if it were the same on the Earth, would keep all the Waters upon it constantly boiling; And the Brightness of the
